

Website Audit Report

<https://rvivl.co/>

Generated: 2026-07-16 16:44

Pages crawled: 22

Automated technical audit covering performance, real-world Core Web Vitals, SEO, page structure, mobile/UX, booking & conversion setup, analytics tracking, and passive security hygiene. Findings are based on a rate-limited crawl of publicly accessible pages and should be used as a prioritized starting point, not an exhaustive guarantee.

Highlighting performance on Mobile & Desktop

Google's PageSpeed Insights, run directly against rvivl.co on July 16, 2026, scored the homepage's mobile experience between 42 and 52 out of 100 across repeated tests - squarely in the range Google itself labels "poor." Desktop, tested the same way at the same time, scored a reasonable 67/100. This is not general slowness. It is a mobile-specific failure on the device most visitors actually use to find and book a local wellness studio.

The clearest single number: Largest Contentful Paint (how long visitors wait to see the main content) ranged from 15.4 seconds to 51.1 seconds on mobile, against Google's "poor" threshold of just 4 seconds and desktop's own 2.9-3.1 seconds. Even the best mobile result recorded is roughly 4x slower than Google's cutoff for acceptable. The worst result is over 10x slower than desktop on the exact same page.

The root cause is visible in the data: mobile testing found up to 79 render-blocking CSS and JavaScript files loading sequentially before any content can render - a direct symptom of Elementor plugin bloat accumulated over time, not a hosting or bandwidth problem. This is confirmed independently by this report's own crawl, which found the homepage loading 77 separate `<script>` tags.

Full PageSpeed Insights reports (mobile and desktop, tested live): pagespeed.web.dev/analysis/https-rvivl-co

If this were an isolated page, it would be a minor note. It isn't - every page tested scored in the same "poor-to-needs-improvement" mobile band. This is a site-wide pattern, and it is actively costing bookings from mobile visitors before they see a single service or price.

Fix These First

The best-value fixes: high impact, low-to-moderate effort

1. Missing H1 heading

High impact - Quick fix - 16 page(s) affected

'https://rvivl.co/' has no H1 tag.

Best fix: Add a single, keyword-relevant H1 via the page/Elementor heading widget.

2. Broken hero background video

High impact - Quick fix - 1 page(s) affected

The homepage's background video (RVIVL-Elevated-Fitness-Recovery....mp4) fails to load with a connection error on both mobile and desktop.

Best fix: Re-upload the video file and verify the URL/path is correct.

3. Images missing lazy-loading

Medium impact - Quick fix - 22 page(s) affected

Below-the-fold images without loading="lazy" force the browser to download them immediately even if the visitor never scrolls that far.

Best fix: Enable Elementor's built-in native lazy-loading (Performance settings).

4. Duplicate page titles across multiple pages

Medium impact - Quick fix - site-wide

2 pages share the exact title "rvivl": <https://rvivl.co/>, <https://rvivl.co/blog>.

Best fix: Write a unique, page-specific title for each affected URL.

5. Broken/404 image asset

Medium impact - Quick fix - 1 page(s) affected

One image (a cropped brandmark thumbnail) returns a 404 error on page load, wasting a request and potentially leaving a broken image icon.

Best fix: Re-upload the missing image or remove the reference to it from the page/theme.

Estimated time to address every finding in this report: ~42-138 hours (a rough scoping estimate for someone familiar with the WordPress/Elementor stack - see the Impact x Effort matrix on the next page for the full breakdown).

Executive Summary

Total issue instances found: 409

Distinct issue types: 44

By Severity

- High: 133
- Medium: 167
- Low: 109

By Category

- Performance: 206
- SEO: 65
- Structure: 45
- Booking/Conversion: 44
- Tracking: 44
- Security: 4
- Accessibility: 1

Impact x Effort Matrix

(counts are distinct issue types found, not per-page instances)

	Quick Fix	Involved
High Impact	6	25
Low Impact	12	1

Estimated time to address every finding: ~42-138 hours total, based on effort tags per issue type. Useful as a rough scope for a fix-it engagement, not a firm quote.

Core Web Vitals by Page

Real-world Google PageSpeed Insights results, Mobile / Desktop side by side ('-' means no data - see the log for whether the API was rate-limited). Mobile is usually worse and more important since it's what most visitors and Google's ranking algorithm primarily evaluate.

Page	Perf (M/D)	LCP (M/D)	CLS (M/D)	INP/TBT (M/D)
/	42 / 67	15.4 s / 3.1 s	0.00 / 0.01	509ms / 62ms

Detailed Findings

HIGH

[Involved]

Performance

1. Excessive script count (over 35 <script> tags)

Page(s): <https://rvivl.co/> (77 scripts), <https://rvivl.co/playa-vista> (68 scripts), <https://rvivl.co/vitamin-ivs> (68 scripts), <https://rvivl.co/blog> (77 scripts) (+18 more)

Why it matters:

Pages with 35+ scripts show a strong sign of plugin/widget bloat typical of heavily-extended Elementor sites. Each script adds parse/network overhead, slowing down every visit.

Possible solutions:

- Audit installed plugins and disable/remove unused ones.
- Consolidate tracking scripts through Google Tag Manager instead of individual plugin tags.
- Use an asset-unloading plugin (Asset CleanUp, Perfmatters) to strip scripts per-page.

HIGH

[Involved]

Performance

2. High Total Blocking Time - TBT (Desktop)

Page(s): <https://rvivl.co/book> (754ms), <https://rvivl.co/cancellation-policies> (3495ms)

Why it matters:

Total Blocking Time over 600ms (a lab proxy for responsiveness) means the main thread is busy long enough to delay input response, typical of heavy script bloat.

Possible solutions:

- Reduce/defer third-party and plugin scripts blocking the main thread.
- Break up long JavaScript tasks; audit plugins for unnecessary JS execution.

HIGH

[Involved]

Performance

3. High Total Blocking Time - TBT (Mobile)

Page(s): <https://rvivl.co/ice-bath> (704ms), <https://rvivl.co/private-events> (825ms)

Why it matters:

Total Blocking Time over 600ms (a lab proxy for responsiveness) means the main thread is busy long enough to delay input response, typical of heavy script bloat.

Possible solutions:

- Reduce/defer third-party and plugin scripts blocking the main thread.
- Break up long JavaScript tasks; audit plugins for unnecessary JS execution.

HIGH

[Involved]

Performance

4. Poor Google PageSpeed score (Desktop)

Page(s): <https://rvivl.co/compression-boots> (43/100), <https://rvivl.co/book> (40/100), <https://rvivl.co/cancellation-policies> (11/100), <https://rvivl.co/rvivlst-iv> (46/100) (+2 more)

Why it matters:

Google's PageSpeed Insights scores real-world desktop performance below 50/100 - the threshold Google itself labels 'poor'. This is the same lab used to compute Core Web Vitals ranking signals in Google Search.

Possible solutions:

- Address the top opportunities PageSpeed flags: Avoid multiple page redirects, Reduce unused CSS, Reduce unused JavaScript.
- Re-run PageSpeed Insights after each fix to confirm the score improves.
- Prioritize mobile first - it's usually the stricter, ranking-determinant strategy.

HIGH

[Involved]

Performance

5. Poor Google PageSpeed score (Mobile)

Page(s): <https://rvivl.co/> (42/100), <https://rvivl.co/playa-vista> (45/100), <https://rvivl.co/terms-and-conditions> (46/100), <https://rvivl.co/infrared-sauna> (43/100) (+10 more)

Why it matters:

Google's PageSpeed Insights scores real-world mobile performance below 50/100 - the threshold Google itself labels 'poor'. This is the same lab used to compute Core Web Vitals ranking signals in Google Search.

Possible solutions:

- Address the top opportunities PageSpeed flags: Reduce unused CSS, Reduce unused JavaScript, Minify JavaScript.
- Re-run PageSpeed Insights after each fix to confirm the score improves.
- Prioritize mobile first - it's usually the stricter, ranking-determinant strategy.

HIGH

[Involved]

Performance

6. Severe mobile/desktop performance gap

Page(s): <https://rvivl.co/>

Why it matters:

Desktop scores 67/100 with a 2.9s LCP - reasonable. Mobile scores only 52/100 with a 51.1s LCP. Since most visitors to a local wellness studio browse and book from their phone, this isn't general slowness, it's a mobile-specific crisis that's likely costing bookings.

Possible solutions:

- Address render-blocking CSS/JS specifically on mobile (79 blocking requests were found taking ~22s combined on mobile vs ~2.2s on desktop under less aggressive network throttling).
- Prioritize deferring/inlining critical CSS.
- Re-test mobile specifically after each fix since desktop is already acceptable.

HIGH

[Involved]

Performance

7. Slow Largest Contentful Paint - LCP (Desktop)

Page(s): <https://rvivl.co/ice-bath> (6.2 s), <https://rvivl.co/fitness-recovery> (4.9 s), <https://rvivl.co/nad> (4.5 s), <https://rvivl.co/myers-iv-page> (4.6 s) (+1 more)

Why it matters:

LCP over 4 seconds is rated 'poor' by Google and means visitors wait a long time to see the main content, hurting both user experience and Core Web Vitals ranking.

Possible solutions:

- Compress and preload the hero image or largest above-the-fold element.
- Remove render-blocking CSS/JS that delays first paint.

- Upgrade hosting/caching so the server responds faster (Time to First Byte).

HIGH

[Involved]

Performance

8. Slow Largest Contentful Paint - LCP (Mobile)

Page(s): <https://rvivl.co/> (15.4 s), <https://rvivl.co/playa-vista> (22.6 s), <https://rvivl.co/terms-and-conditions> (16.4 s), <https://rvivl.co/infrared-sauna> (16.9 s) (+15 more)

Why it matters:

LCP over 4 seconds is rated 'poor' by Google and means visitors wait a long time to see the main content, hurting both user experience and Core Web Vitals ranking.

Possible solutions:

- Compress and preload the hero image or largest above-the-fold element.
- Remove render-blocking CSS/JS that delays first paint.
- Upgrade hosting/caching so the server responds faster (Time to First Byte).

HIGH

[Involved]

Performance

9. Very large total page weight (17.9MB on desktop)

Page(s): <https://rvivl.co/>

Why it matters:

Total network payload (all images, scripts, fonts, video) is 17.9MB, far above the ~1-3MB guideline for a fast-loading marketing page. This is measured by Google's own PageSpeed tool, not just our crawler's HTML size check.

Possible solutions:

- Compress/resize the largest images and the background video.
- Audit for any unused plugin assets loading on every page.
- Consider lazy-loading or removing the autoplay background video entirely on mobile.

HIGH

[Quick]

SEO

10. Missing H1 heading

Page(s): <https://rvivl.co/>, <https://rvivl.co/playa-vista>, <https://rvivl.co/vitamin-ivs>, <https://rvivl.co/blog> (+12 more)

Why it matters:

'<https://rvivl.co/>' has no H1 tag. The H1 is a primary relevance signal for search engines and an accessibility landmark for screen reader users.

Possible solutions:

- Add a single, keyword-relevant H1 via the page/Elementor heading widget.
- Check Elementor templates - sometimes the H1 is styled as a <div> or instead of a semantic heading tag.

HIGH

[Quick]

Structure

11. Broken hero background video

Page(s): <https://rvivl.co/>

Why it matters:

The homepage's background video (RVIVL-Elevated-Fitness-Recovery....mp4) fails to load with a connection error on both mobile and desktop. Visitors currently see a broken/blank hero section instead of the intended video.

Possible solutions:

- Re-upload the video file and verify the URL/path is correct.
- Confirm hosting/CDN isn't blocking large media files.
- Test the fix on both mobile and desktop.

HIGH

[Involved]

Structure

12. Duplicated header/nav/footer HTML on the same page

Page(s): <https://rvivl.co/>, <https://rvivl.co/playa-vista>, <https://rvivl.co/vitamin-ivs>, <https://rvivl.co/blog> (+18 more)

Why it matters:

'<https://rvivl.co/>' renders 1 <header>, 6 <nav>, and 0 <footer> element(s). Duplicate structural markup is a known issue on this site, likely from an Elementor global header/footer template stacking on top of the theme's own header/footer, or a template being included twice.

Possible solutions:

- Check Elementor > Theme Builder for duplicate header/footer templates assigned to the same condition.
- Inspect the page source for a theme-level header/footer plus an Elementor-inserted one and remove the redundant copy.
- If intentional (e.g. a secondary mobile nav), mark the duplicate with aria-hidden or a distinct landmark role to avoid confusing assistive tech and site audits.

HIGH

[Moderate]

Tracking

13. Duplicate Google Tag Manager containers on one page

Page(s): <https://rvivl.co/> (loads 2x), <https://rvivl.co/playa-vista> (loads 2x), <https://rvivl.co/vitamin-ivs> (loads 2x), <https://rvivl.co/blog> (loads 2x) (+18 more)

Why it matters:

Duplicate GTM containers cause double-firing of tags/events, inflating analytics numbers and possibly double-counting ad conversions.

Possible solutions:

- Search the theme header/footer AND any SEO/analytics plugin settings for a hardcoded GTM snippet, then remove the duplicate.
- Standardize on a single injection method (e.g. only via a plugin, not also hardcoded in theme files).

MEDIUM

[Moderate]

Booking/Conversion

14. Off-site checkout/booking redirect

Page(s): <https://rvivl.co/> (1 link(s), e.g. <https://momence.com/RVIVL/gift-card-checkout/39490>), <https://rvivl.co/playa-vista> (1 link(s), e.g. <https://momence.com/RVIVL/gift-card-checkout/39490>), <https://rvivl.co/vitamin-ivs> (4 link(s), e.g. <https://momence.com/RVIVL/gift-card-checkout/39490>), <https://rvivl.co/blog> (1 link(s), e.g. <https://momence.com/RVIVL/gift-card-checkout/39490>) (+18 more)

Why it matters:

Links that send visitors straight to an external booking/checkout domain can lose conversion tracking (GTM/Pixel events firing only on-site) and interrupt branded UX.

Possible solutions:

- Embed the booking widget in an iframe on-site instead of a raw external link where the platform supports it.

- Fire a tracking event (GTM click trigger) on the outbound link so conversions aren't lost.
- Verify the destination domain matches the currently intended booking platform (see migration note above).

MEDIUM

[Quick]

Performance

15. Broken/404 image asset

Page(s): <https://rvivl.co/>

Why it matters:

One image (a cropped landmark thumbnail) returns a 404 error on page load, wasting a request and potentially leaving a broken image icon.

Possible solutions:

- Re-upload the missing image or remove the reference to it from the page/theme.

MEDIUM

[Quick]

Performance

16. Images missing lazy-loading

Page(s): <https://rvivl.co/> (10 images), <https://rvivl.co/playa-vista> (2 images), <https://rvivl.co/vitamin-ivs> (4 images), <https://rvivl.co/blog> (10 images) (+18 more)

Why it matters:

Below-the-fold images without loading="lazy" force the browser to download them immediately even if the visitor never scrolls that far.

Possible solutions:

- Enable Elementor's built-in native lazy-loading (Performance settings).
- Use a lazy-load plugin (a3 Lazy Load, WP Rocket's LazyLoad) if not built-in.
- Manually add loading="lazy" to below-the-fold tags.

MEDIUM

[Moderate]

Performance

17. Moderate Google PageSpeed score (Desktop)

Page(s): <https://rvivl.co/> (67/100), <https://rvivl.co/playa-vista> (52/100), <https://rvivl.co/vitamin-ivs> (63/100), <https://rvivl.co/blog> (59/100) (+12 more)

Why it matters:

A desktop PageSpeed score under 90 leaves room for improvement before hitting Google's 'good' performance threshold.

Possible solutions:

- Address the top opportunities: Reduce unused CSS, Reduce unused JavaScript, Minify JavaScript.
- Re-test after fixes to track improvement over time.

MEDIUM

[Moderate]

Performance

18. Moderate Google PageSpeed score (Mobile)

Page(s): <https://rvivl.co/compression-boots> (51/100), <https://rvivl.co/red-light-therapy-2> (54/100), <https://rvivl.co/cancellation-policies> (55/100), <https://rvivl.co/rvivlst-iv> (55/100) (+1 more)

Why it matters:

A mobile PageSpeed score under 90 leaves room for improvement before hitting Google's 'good' performance threshold.

Possible solutions:

- Address the top opportunities: Reduce unused JavaScript, Reduce unused CSS, Avoid multiple page redirects.
- Re-test after fixes to track improvement over time.

MEDIUM

[Moderate]

Performance

19. Moderate Largest Contentful Paint - LCP (Desktop)

Page(s): <https://rvivl.co/> (3.1 s), <https://rvivl.co/playa-vista> (3.7 s), <https://rvivl.co/vitamin-ivs> (3.5 s), <https://rvivl.co/blog> (3.1 s) (+13 more)

Why it matters:

LCP between 2.5-4s is rated 'needs improvement' by Google.

Possible solutions:

- Compress the largest above-the-fold image and serve it in a modern format.
- Preload critical resources and defer non-critical scripts.

MEDIUM

[Moderate]

Performance

20. Moderate Total Blocking Time - TBT (Desktop)

Page(s): <https://rvivl.co/playa-vista> (269ms), <https://rvivl.co/blog> (209ms), <https://rvivl.co/compression-boots> (585ms), <https://rvivl.co/red-light-therapy-2> (245ms) (+1 more)

Why it matters:

TBT between 200-600ms leaves some room for improvement in perceived responsiveness.

Possible solutions:

- Defer non-critical scripts and reduce third-party script count.

MEDIUM

[Moderate]

Performance

21. Moderate Total Blocking Time - TBT (Mobile)

Page(s): <https://rvivl.co/> (509ms), <https://rvivl.co/playa-vista> (430ms), <https://rvivl.co/terms-and-conditions> (394ms), <https://rvivl.co/infrared-sauna> (526ms) (+8 more)

Why it matters:

TBT between 200-600ms leaves some room for improvement in perceived responsiveness.

Possible solutions:

- Defer non-critical scripts and reduce third-party script count.

MEDIUM

[Moderate]

Performance

22. Moderately slow page load time (1.5-3s)

Page(s): <https://rvivl.co/memberships>, <https://rvivl.co/private-events>

Why it matters:

'<https://rvivl.co/memberships>' took 2.61s to respond. This is above the ~1s target for good perceived performance and may soft-cap conversion rates.

Possible solutions:

- Enable page/object caching and compress images site-wide.

- Minify and combine CSS/JS via a performance plugin.
- Review third-party scripts (booking widgets, chat, analytics) for load impact.

MEDIUM

[Moderate]

Performance

23. Poor visual stability - high CLS (Desktop)

Page(s): <https://rvivl.co/cancellation-policies> (0.58), <https://rvivl.co/rvivilst-iv> (0.38), <https://rvivl.co/nad> (0.69), <https://rvivl.co/myers-iv-page> (0.33)

Why it matters:

A Cumulative Layout Shift above 0.25 is rated 'poor' - visible content jumps around as the page loads, which is jarring and can cause mis-clicks.

Possible solutions:

- Add explicit width/height to all images and embeds so space is reserved before they load.
- Avoid injecting banners/ads above existing content after initial render.

MEDIUM

[Moderate]

Performance

24. Poor visual stability - high CLS (Mobile)

Page(s): <https://rvivl.co/nad> (0.66), <https://rvivl.co/myers-iv-page> (0.61)

Why it matters:

A Cumulative Layout Shift above 0.25 is rated 'poor' - visible content jumps around as the page loads, which is jarring and can cause mis-clicks.

Possible solutions:

- Add explicit width/height to all images and embeds so space is reserved before they load.
- Avoid injecting banners/ads above existing content after initial render.

MEDIUM

[Moderate]

Performance

25. Render-blocking scripts in <head>

Page(s): <https://rvivl.co/> (4 found), <https://rvivl.co/playa-vista> (4 found), <https://rvivl.co/vitamin-ivs> (4 found), <https://rvivl.co/blog> (4 found) (+18 more)

Why it matters:

Several pages load scripts in the <head> without async/defer, delaying the browser's ability to render visible content (impacts First Contentful Paint).

Possible solutions:

- Add the 'defer' attribute to non-critical head scripts.
- Move non-essential scripts to load just before </body>.
- Use a performance plugin's 'delay JavaScript execution' feature.

26. Duplicate page titles across multiple pages

Page(s): site-wide

Why it matters:

2 pages share the exact title "rvivl": <https://rvivl.co/>, <https://rvivl.co/blog>. Duplicate titles make it harder for search engines to determine which page is most relevant for a query.

Possible solutions:

- Write a unique, page-specific title for each affected URL.
- Check if these are auto-generated by an Elementor template applied identically across pages.

27. Duplicate/near-duplicate main content across multiple pages

Page(s): site-wide

Why it matters:

2 pages have effectively identical main body content (ignoring shared header/nav/footer): <https://rvivl.co/>, <https://rvivl.co/blog>. This can trigger search engine duplicate-content filtering, causing only one page to rank.

Possible solutions:

- Differentiate the pages' content, or canonicalize the duplicates to a single primary page.
- If pages are meant to be nearly identical (e.g. seasonal duplicates), consolidate into one page with a canonical tag.

28. Images missing alt text

Page(s): <https://rvivl.co/> (3 of 13 missing), <https://rvivl.co/vitamin-ivs> (5 of 9 missing), <https://rvivl.co/blog> (3 of 13 missing), <https://rvivl.co/infrared-sauna> (11 of 15 missing) (+7 more)

Why it matters:

Images without alt attributes hurt image SEO and accessibility (screen readers cannot describe the image to visually impaired visitors).

Possible solutions:

- Add descriptive alt text to each image in the Media Library.
- For purely decorative images, use alt="" explicitly rather than omitting it.

29. Missing recommended security headers

Page(s): <https://rvivl.co/> (HSTS, X-Content-Type-Options, X-Frame-Options, CSP)

Why it matters:

The site is missing: HSTS, X-Content-Type-Options, X-Frame-Options, CSP. These headers are defense-in-depth measures against clickjacking, MIME-sniffing, and content injection - they don't fix a specific vulnerability but are considered baseline hygiene.

Possible solutions:

- Add missing headers via a security plugin (Really Simple SSL, Wordfence) or host/CDN config (e.g. Cloudflare).
- Start with X-Content-Type-Options and X-Frame-Options (low risk of breaking anything); test

MEDIUM

[Quick]

Security

30. Mixed content blocks web fonts from loading

Page(s): <https://rvivl.co/> (likely site-wide, since fonts are loaded from the theme)

Why it matters:

The site loads Montserrat and Raleway font files over insecure <http://> on an <https://> page. Browsers silently block these (20+ blocked requests observed), meaning visitors likely see fallback system fonts instead of the intended brand typography - a silent brand-consistency bug with no visible error.

Possible solutions:

- Find the hardcoded <http://> font references (likely in an Elementor Google Fonts cache) and update to <https://>.
- Clear/regenerate any font-caching plugin data after fixing.

MEDIUM

[Moderate]

Structure

31. Heavy inline/embedded style bloat (over 8KB of CSS text)

Page(s): <https://rvivl.co/> (~51KB), <https://rvivl.co/playa-vista> (~46KB), <https://rvivl.co/vitamin-ivs> (~46KB), <https://rvivl.co/blog> (~51KB) (+18 more)

Why it matters:

Large amounts of inline `style=""` attributes and embedded `<style>` blocks are a hallmark of Elementor's per-widget inline CSS generation at scale. This bloats HTML weight and makes styling harder to maintain.

Possible solutions:

- Enable Elementor's 'Improved CSS Loading' / external file generation in Performance settings.
- Regenerate Elementor CSS files (Elementor > Tools > Regenerate CSS).
- Reduce the number of nested Elementor sections/columns on heavy pages.

LOW

[Quick]

Accessibility

32. Heading hierarchy skips levels

Page(s): <https://rvivl.co/>

Why it matters:

A 'From Our Clients' section uses an H6 with no intervening heading levels, which breaks the semantic outline screen reader users rely on to navigate.

Possible solutions:

- Change the heading to the correct sequential level (likely H2 or H3 depending on the page outline).

Booking/Conversion

33. Booking platform reference: Momence

Page(s): <https://rvivl.co/>, <https://rvivl.co/playa-vista>, <https://rvivl.co/vitamin-ivs>, <https://rvivl.co/blog> (+18 more)

Why it matters:

'<https://rvivl.co/>' references Momence 4 time(s). Noted for confirmation this is the current, intended booking platform.

Possible solutions:

- Confirm this is the sole active booking platform across the whole site.

LOW

[Quick]

Performance

34. Images missing explicit width/height

Page(s): <https://rvivl.co/> (8 images), <https://rvivl.co/playa-vista> (2 images), <https://rvivl.co/vitamin-ivs> (2 images), <https://rvivl.co/blog> (8 images) (+18 more)

Why it matters:

Images without width/height attributes can cause layout shift (poor Cumulative Layout Shift score) as they load in.

Possible solutions:

- Re-save/re-insert images through the Media Library so Elementor sets dimensions.
- Add explicit width/height (or aspect-ratio CSS) to affected image tags.

LOW

[Quick]

Performance

35. Moderate visual stability - CLS (Mobile)

Page(s): <https://rvivl.co/private-events> (0.14)

Why it matters:

A CLS between 0.1-0.25 is rated 'needs improvement'.

Possible solutions:

- Add explicit width/height to images to reserve space before they load.

LOW

[Quick]

Performance

36. Moderately large image (300KB-1MB)

Page(s): <https://rvivl.co/rvivlst-iv> (.../NAD-Nicotinamide-Adenine-Dinucleotide-is-a-cruc..., 453KB), <https://rvivl.co/nad> (.../NAD-Nicotinamide-Adenine-Dinucleotide-is-a-cruc..., 488KB), <https://rvivl.co/myers-iv-page> (.../Ascorbic-Acid-Vitamin-C-2500mg-B5-Dexapanthanol..., 383KB)

Why it matters:

These images are larger than the ~200-300KB guideline for web images.

Possible solutions:

- Run through an image compression plugin or tool before re-uploading.
- Consider WebP format for better compression.

LOW

[Quick]

SEO

37. Duplicate meta descriptions across multiple pages

Page(s): site-wide

Why it matters:

2 pages share an identical meta description: <https://rvivl.co/>, <https://rvivl.co/blog>.

Possible solutions:

- Write a unique meta description per page reflecting that page's specific content.

38. Images missing alt text

Page(s): <https://rvivl.co/playa-vista> (1 of 5 missing), <https://rvivl.co/terms-and-conditions> (1 of 5 missing), <https://rvivl.co/compression-boots> (2 of 6 missing), <https://rvivl.co/privacy-policy> (1 of 5 missing) (+7 more)

Why it matters:

Images without alt attributes hurt image SEO and accessibility (screen readers cannot describe the image to visually impaired visitors).

Possible solutions:

- Add descriptive alt text to each image in the Media Library.
- For purely decorative images, use alt="" explicitly rather than omitting it.

39. Link could not be auto-verified: <https://www.instagram.com/rvivl.co> (HTTP 429)

Page(s): <https://rvivl.co/>, <https://rvivl.co/playa-vista>, <https://rvivl.co/vitamin-ivs>, <https://rvivl.co/blog> (+1 more)

Why it matters:

This link returned HTTP 429 to our automated checker, which is common for social platforms (Instagram, LinkedIn, etc.) that block bots/rate-limit non-browser requests. It may work fine for real visitors - verify manually before treating it as broken.

Possible solutions:

- Open the link in a normal browser to confirm it actually works.
- If it's genuinely broken, update or remove it; if it just blocks bots, no action needed.

40. Meta description too long (over 160 chars)

Page(s): <https://rvivl.co/vitamin-ivs> (358 chars), <https://rvivl.co/terms-and-conditions> (428 chars), <https://rvivl.co/infrared-sauna> (304 chars), <https://rvivl.co/compression-boots> (363 chars) (+13 more)

Why it matters:

Descriptions beyond ~160 characters will be truncated in search results.

Possible solutions:

- Trim to ~155 characters while keeping the key value proposition.

41. Non-descriptive link text

Page(s): <https://rvivl.co/>, <https://rvivl.co/contrast-therapy-2-2>

Why it matters:

A 'Learn More' link has no surrounding context for search engines or screen reader users to understand its destination.

Possible solutions:

- Change link text to be descriptive on its own, e.g. 'Learn more about Contrast Therapy'.

42. Plugin/theme versions exposed via asset URLs

Page(s): <https://rvivl.co/>

Why it matters:

Asset query strings reveal exact plugin/theme versions (e.g. reviews-feed-pro 2.1.0, instagram-feed-pro 6.7.0, elementor 4.1.5), letting automated scanners quickly check for known vulnerabilities in those specific versions.

Possible solutions:

- Use a security plugin to strip version query strings from asset URLs.
- Keep all plugins/themes updated regardless - this is a disclosure risk, not a vulnerability test.

43. WordPress version publicly exposed

Page(s): <https://rvivl.co/>

Why it matters:

The site discloses WordPress version 6.9.4 via the generator meta tag. This isn't a vulnerability by itself, but it makes it trivial for automated scanners to check whether that version has known CVEs.

Possible solutions:

- Remove the generator meta tag (many security plugins offer a one-click toggle for this).
- Keep WordPress core updated regardless - hiding the version is obscurity, not real protection.

44. GA4 loaded both directly and via GTM

Page(s): <https://rvivl.co/>, <https://rvivl.co/playa-vista>, <https://rvivl.co/vitamin-ivs>, <https://rvivl.co/blog> (+18 more)

Why it matters:

'<https://rvivl.co/>' appears to load a direct gtag.js/GA4 snippet in addition to Google Tag Manager. If GA4 is also configured as a tag inside GTM, this can double-count pageviews.

Possible solutions:

- Confirm whether GA4 is configured inside GTM; if so, remove the hardcoded gtag.js snippet.
- Check GA4 Realtime reports for duplicate pageview events to confirm before removing anything.
